

Build the strongest truthful case.

A \$0 applicant-controlled workspace that turns a real job listing and a real CV into source-linked evidence, rehearsed answers, approval-gated documents, and a human-owned final application.

Not another resume checker.

Most career tools stop at a score, a keyword list, or a confident rewrite. HireSwarm asks a harder question: **could the candidate defend this exact sentence when an interviewer probes it?**

The live promise

Every application edit carries an evidence ID. Every interview answer uses the same ledger. Every external application remains in the applicant's hands.

STACK

Next.js · FastAPI · optional CrewAI

DESIGNED FOR

real data + reliable no-key judging

Why HireSwarm is credible rather than generic

The project is intentionally not positioned as a “better ATS score.” Trackers, scanners, and generators are mature categories. The differentiated unit is a **defensible application packet**: source provenance, claim-level proof, rehearsal consistency, readable export, and applicant control.

Trackers organize

Jobs, statuses, contacts, reminders, and documents. Useful, but a tracker does not tell you whether a tailored claim is defensible.

Scanners compare

Resume-to-job keyword matching reveals gaps, but a percentage is not an employer ATS simulation or interview prediction.

Generators draft

Fast rewriting creates speed, but also raises fabrication and generic-voice risk when claims are not bounded by evidence.

HireSwarm changes the central question

Instead of	HireSwarm asks	System behavior
“How can we raise the score?”	“What can you prove directly?”	Direct, adjacent, and missing proof stay distinct.
“Can AI make this sound stronger?”	“Would you say this under interview pressure?”	Candidate Twin and HR Interrogator use the same evidence ledger.
“Can we apply faster?”	“Can you make a confident final decision?”	Export is locked until applicant approval; submission is manual.

A product that refuses flattering fiction produces a better demo moment: Docker experience is relevant context for Kubernetes, but it is not silently upgraded to production Kubernetes ownership.

Four visible roles, one deterministic truth boundary

The agent roles are not decorative. Each has a narrow, human-readable responsibility and a boundary it cannot cross. Provider-backed CrewAI narration is optional; the deterministic validator remains the authority.

01 Market Scout	Maps a published or pasted role to direct strengths, adjacent evidence, true gaps, and coverage.	BOUNDARY Cannot relabel related experience as direct proof.
02 Candidate Twin	Builds answer drafts from source-linked CV evidence only.	BOUNDARY Cannot answer from a claim absent from the ledger.
03 HR Interrogator	Tests the answer at the boundary: supported, partial, or unsupported.	BOUNDARY Keeps a real gap visible rather than rewarding confidence.
04 Resume Surgeon	Turns verified proof into focused revisions and a cover letter.	BOUNDARY Every patch must retain evidence IDs to survive validation.

The result is an evidence chain a judge can see live: job requirement → original CV line → interview answer → suggested resume revision → applicant approval → export.

What makes the experience work beyond fixtures

	PROVENANCE STATES Practice fixture Deterministic, no-key, visibly labeled. Live public listing Published source, source URL, retrieval/cache state retained. Pasted by you Candidate-provided role text, optionally with an official URL. WHAT WE DO NOT DO • scrape login-protected job boards • use employer credentials • submit external applications • substitute fixtures after a live-source failure • claim proprietary ATS prediction
CV import is real PDF, DOCX, and TXT CVs are parsed in memory (6 MB cap). Readable text becomes conservative evidence. Image-only PDFs fail clearly; source binaries are not retained.	
Published roles are real Remotive and Arbeitnow discovery is user-triggered. A public Greenhouse or Lever board URL/token loads documented read-only job postings and preserves the official apply URL.	
Document QA is real The app generates a one-column PDF, then extracts its text with pypdf. This is an export-readiness test, not a fabricated “ATS guarantee.”	

Reliability proof

11 offline backend tests	Direct/adjacent gap handling · evidence-linked patches · interview honesty · public-board URL parsing · CV import · real DOCX output · PDF text round trip.
Typed SSE workflow	The frontend receives actual mission events from FastAPI instead of replaying a scripted animation.
Graceful degradation	No provider key? Evidence Lab works. Public source unavailable? Show an error and preserve manual paste. No document text? Explain the limitation.

A story that proves utility, not just UI

0:00–0:12	Open Find live roles; connect a public Greenhouse or Lever board or search public feeds. Call out the source badge and direct apply link.
0:12–0:25	Import a CV. Point to the in-memory/no-retention message and the number of extracted evidence nodes.
0:25–0:48	Run the focused rehearsal. Let the live event stream move from Market Scout through Candidate Twin and HR Interrogator.
0:48–1:03	Pause on a boundary: direct proof vs adjacent evidence vs a real gap. This is the credibility moment.
1:03–1:18	Open source-linked revisions; show evidence IDs and the separate cover letter.
1:18–1:30	Show Document QA, approve as the human, download PDF/DOCX, and open the official listing manually.

Why this can place

Real-world utility Solves a concrete applicant pain: making a focused, honest case from a live role and their own CV.	Technical depth Typed FastAPI/SSE flow, public connectors, document parsing, deterministic validation, actual exports, optional CrewAI.	Responsible AI Evidence before language, explicit uncertainty, no fake live data, minimal retention, human control at the final gate.

The takeaway

HireSwarm does not promise an interview. It gives an applicant something more durable: a clear, evidenced story they can actually stand behind.
